

AGRISPON®

Brussel Sprouts

England

Fertilization: All areas received 60, 200, and 200 lb./acre of N, P and K, respectively before planting. About 45 days later an additional topdressing of N was applied to the first three treatments: 180 lb/acre for treatments 1 and 2, and 60 lb./acre for treatment 3.

Agrispon treatments: All transplants of treatments 2, 3, and 4 were dipped in a 10% Agrispon solution at planting. In late June, 10 to 14 days after topdressing, 1.5 liters/hectare of Agrispon were sprayed over the plants and soil of treatments 2, 3, and 4.
